```

```

Loaded CSV: fitness_blog_dataset.csv
Shape : (201, 4)
Columns: ['title', 'url', 'articletext', 'articlecharlength']

Dataset source : Custom Generated from blogs from https://www.healthline.com/nutrition
Total characters: 1,214,746

Total sentences found : 10,962
Sentences used (cap) : 10,000
Total tokens : 183,524
Unique tokens (vocab) : 8,883

```

Sample tokenized sentences:

```

[1] ['The', 'amount', 'of', 'protein', 'you', 'need', 'depends', 'on', 'many', 'factors', 'including', 'activity']...
[2] ['Protein', 'is', 'one', 'of', 'three', 'essential', 'macronutrients', 'alongside', 'carbohydrates', 'and', 'fats']
[3] ['These', 'are', 'nutrients', 'that', 'the', 'human', 'body', 'needs', 'in', 'relatively', 'large', 'quantities']...

```

Task 2 - Generate Ground-truth POS tags & Split Train-Test sets

Generate ground-truth POS tags using a standard library and split your dataset into an 80% training set and a 20% testing set.

```

In [4]: #Position Tagging the sentences using NLTK Library function
tagged_sentences = [
    nltk.pos_tag(tokens, tagset="universal")
    for tokens in tokenized_sentences
]

# Show sample
print("\nSample POS-tagged sentence:")
print(f" {tagged_sentences[0][:10]}")

# Tag distribution
tag_counts = collections.Counter(
    tag for sent in tagged_sentences for _, tag in sent
)
print(f"\nTag distribution (all {len(tag_counts)} tags):")
for tag, cnt in tag_counts.most_common():
    print(f" {tag:<8} {cnt:>8,} ({cnt/len(all_tokens)*100:.1f}%)")

# Train / Test split (80 / 20)
n_total = len(tagged_sentences)
n_train = int(n_total * TRAIN_RATIO)
n_test = n_total - n_train

train_data = tagged_sentences[:n_train]
test_data = tagged_sentences[n_train:]

print(f"\nTotal tagged sentences : {n_total:,}")
print(f"Training set : {n_train:,} ({TRAIN_RATIO*100:.0f}%)")
print(f"Testing set : {n_test:,} ({(1-TRAIN_RATIO)*100:.0f}%)")

```

Sample POS-tagged sentence:

```

[('The', 'DET'), ('amount', 'NOUN'), ('of', 'ADP'), ('protein', 'NOUN'), ('you', 'PRON'), ('need', 'VERB'), ('depends', 'NOU
N'), ('on', 'ADP'), ('many', 'ADJ'), ('factors', 'NOUN')]

```

Tag distribution (all 12 tags):

NOUN	55,560	(30.3%)
VERB	35,738	(19.5%)
ADJ	22,626	(12.3%)
ADP	21,092	(11.5%)
DET	13,962	(7.6%)
PRON	8,586	(4.7%)
ADV	8,445	(4.6%)
CONJ	7,400	(4.0%)
NUM	5,086	(2.8%)
PRT	4,940	(2.7%)
.	54	(0.0%)
X	35	(0.0%)

```

Total tagged sentences : 10,000
Training set : 8,000 (80%)
Testing set : 2,000 (20%)

```

Task 3: Training a Bigram HMM Model & Generate Confusion Matrix

Train a Bigram HMM on the training set and predict the tags for the testing set. Generate a Confusion Matrix for the top 5 most frequent tags (e.g., NOUN, VERB, ADJ, ADV, PRON) to compare predicted tags against ground truth.

```

Task 5: Discussion — Tagging Errors and the Markov Assumption

Discuss common tagging errors observed in your confusion matrix. How does the Markov assumption help or fail in resolving these specific syntactic ambiguities?

5.1 Common Tagging Errors Observed in the Confusion Matrix

The Bigram HMM achieved **90.53% overall accuracy** on the Healthline nutrition/fitness test set. Three key error patterns emerge from the confusion matrix:

NOUN → VERB misclassification (most frequent error) NOUN has the largest support (10,838 tokens, 30.3%) but its recall (0.8853) lags behind its precision (0.9283), meaning true NOUNs are frequently mislabelled as VERBs. Fitness vocabulary is the main culprit — words like *supplement*, *exercise*, *diet*, *lift* and *train* appear as both parts of speech with near-equal frequency, making the tag ambiguous from emission probability alone.

ADJ → NOUN confusion (weakest top-5 F1: 0.83) Nutrition writing uses many adjectives nominally — "*eating healthy*", "*the lean in his body*" — where the local context (DET → ?) gives similar probability to both ADJ and NOUN, producing consistent errors in both directions.

Residual '.' and 'X' contamination (Precision: 0.05 / 0.04) Despite pre-cleaning, 89 tokens were still ground-truthed as '.' or 'X' (nutritional notation such as "*2g*", "*500kcal*"). The HMM almost never predicts these rare tags correctly, and its occasional mispredictions of them pollute the boundaries of neighbouring tags.

5.2 How the Markov Assumption Helps — and Fails

Where it helps:

- **DET → NOUN** chains ("*the protein*", "*a workout*") are near-deterministic, directly contributing to NOUN's high precision of 0.9283.
- **ADP** achieves the best F1 (0.94) because prepositional phrases ("*for muscle growth*", "*after exercise*") follow consistent ADP → NOUN transitions.
- **CONJ** reaches perfect recall (1.00) since coordinating conjunctions always appear between same-category tokens, making them unambiguous for any bigram model.

Where it fails:

- **Long-range dependencies** — in "*The muscles that you train every day grow stronger*", the bigram sees only ADV before VERB, missing the distant NOUN subject entirely.
- **Lexical ambiguity with identical local context** — VERB → *supplement* / *exercise* / *diet* can be either NOUN or VERB, and a single preceding tag is insufficient to disambiguate.

- **OOV nutritional tokens** ("50g", "omega-3") collapse to a uniform `<UNK>` emission, forcing the model to default to the most frequent tag (NOUN), causing the residual X and '.' errors seen in the report.

5.3 Conclusion

The Bigram HMM handles deterministic local patterns well but the 9.47% error rate is concentrated in domain-specific lexical ambiguity and long-range structure that a single preceding tag cannot resolve. A Trigram HMM, CRF, or BERT-based tagger would directly address these remaining errors by conditioning on broader context.

System Details

```
